SUMMARY

Founding engineer on two products at InMobi. I build AI systems that run inside constraints I don't control: another platform's policy, a partner's own site, a client's spreadsheet. One of three on a new AI monetization platform since its first commit, where I own the monetization surface, plus the embeddable answer surface I started building on it. Two tools shipped solo, end to end, and an LLM inside a live approval path.

EXPERIENCE

Software Development Engineer · InMobi, Bengaluru Jun 2025 - present

Founding engineer on two products (one of three on the platform) since Mar 2026. Earlier: ad compliance and content automation.

- **LLM systems in production.** Built the generation surface on Gemini and Claude with Imagen 4, behind a prompt engine with per-feed config. Also a concept-discovery service and semantic image search over embeddings.
- **Ad-compliance proxy (Python/FastAPI).** Validates campaigns against network policy before their traffic reaches Google: HMAC-signed requests, Redis-backed approval state, a creative-change poller that auto-pauses drift, a review API, and an **LLM auto-approval layer**.
- **Identity rebuilt from scratch (IAM v3).** Three-tier org hierarchy, dynamic roles and permission mapping, SSO and JWT, invite flows. Owned across the FastAPI backend and Next.js frontend.
- **Cut auth and dashboard latency ~8× on the Redis-degraded path** (2s to 0.25s per operation) with a circuit breaker, cluster client, L1 cache and N+1 elimination. Migrated image storage S3 → Google Cloud Storage with CDN cutover.
- **Embeddable AI answer surface — founding engineer, and I started the build.** One script tag puts a retrieval-augmented answer surface on a publisher's site: per-partner content manifest, closed Shadow DOM isolation, origin-allowlist auth, 8 configurable in-answer ad placements. Wrote the proof of concept end to end (SDK, backend, admin console); now a product in development.
- **Meta Ads bulk uploader**, built and deployed solo: a spreadsheet becomes up to **5,000 ads**, every entity created paused so nothing spends by accident. Python CLI + FastAPI/htmx, SSE, pytest suite.
- **Breadth and hardening.** Integrations across **8 ad networks and feeds** with per-partner config. Pen-test remediation, the backend's Docker/Jenkins container build, dbt revenue models.

Product Analyst · Glance, Bengaluru Jun - Aug 2024

- Built and maintained **4 Superset dashboards carrying 50+ charts** across the USA and Singapore clusters, including a product-alert dashboard surfacing daily engagement deviations by OEM and region. Regional deep dives across 30+ metrics, reported fortnightly.

AI Project Intern · IBM India Jun - Jul 2024

- Led a plant-disease detection and prediction project to **92% accuracy**, refining the model with agricultural experts. NLP research alongside it.

Summer Research Intern · IIT Delhi 2023

- “Fault Detection and Diagnosis in PEMFC using AI”, under Dr. Anil Verma. AI methods applied to fault detection in operating proton-exchange-membrane fuel cells.

Summer Trainee, twice · DRDO, Ministry of Defence 2022, 2023

- **DEAL, Dehradun (2023):** “MAC Protocols in Tactical MANET”, IP Based Protocols Group. Built simulated network environments in NS2, compared MAC protocols under varying conditions, delivered a technical report with **10 recommendations**. **IRDE (2022):** electronic circuit design and logic gates.

Co-founder · Fintech prototype Nov 2021 - Sep 2022

- With **two co-founders**, built an investment-aggregator prototype: crypto, stocks and NFTs in one account, with portfolio tracking and personalised insights. I owned the market research. **Sold the prototype and its IP** while still an undergraduate.

SELECTED PROJECTS

- **Mercury Works** (open source, MIT · with Piyush Rane) — an autonomous AI creative agency: one sentence of brand brief becomes a live brand, from research and naming through design, illustration, a voiceover radio ad and a deployed site with checkout, with zero human edits. **Shipped 11 real live brand sites in an 8-hour buildathon** (GrowthX Hermes).
- **Munshi** (with Piyush Rane) — a bilingual Hindi/English health-insurance claims processor: reads handwritten medical documents and generates submittable claim packets, using a **two-model agreement check that abstains instead of guessing**. Sarvam × GrowthX Epoch Buildathon.

SKILLS

Languages	Python (FastAPI) · TypeScript / JavaScript · PHP (Laravel) · SQL
Applied AI	Gemini · Claude · Imagen 4 · Groq/Llama · RAG · embeddings and semantic search · prompt engineering · agent pipelines · evals and abstention · PyTorch · scikit-learn · OpenCV
Systems & data	Next.js / React · React Native · NestJS · htmx · PostgreSQL / AlloyDB / Neon · pgvector · Redis (cluster, circuit breaker) · dbt · Server-Sent Events · Shadow DOM SDKs
Cloud & security	GCP · AWS · Docker · Jenkins · Helm · Nginx · IAM/RBAC · OAuth/SSO · JWT · HMAC · session invalidation · pen-test remediation
Ad platforms	Meta Ads API · Google Ads / AFS / RSOC · Bing · Outbrain · Taboola · MGID · Yahoo · AdSense

EDUCATION

B.Tech, Computer Science & Engineering · UPES Dehradun, 2021–2025. Coursework in AI/ML and cloud computing.

CERTIFICATIONS & RECOGNITION

Published “Use of AI and Its Benefits on Quality Assurance (QA)” in the journal of the DGQA, India's Ministry of Defence (circulation 5,000+). Core member and event coordinator, UPES Coding Club: organised a 150+ participant hackathon. GrowthX builder community. Microsoft AI-102, AWS Academy Graduate, QSim (IIT Roorkee).
